Overview of the SKE 11 Check Synchronising Relay

What Is the SKE 11 Check Synchronising Relay?

The SKE 11 check synchronising relay is a protective and control device used primarily in power generation and distribution systems. Its core function is to verify the compatibility of voltage, frequency, phase sequence, and phase angle before allowing two sources—often a generator and the grid—to synchronize. This automatic verification ensures that synchronization occurs only when all parameters are within acceptable limits, thereby preventing system disturbances, equipment damage, or power outages.

Key Features and Specifications

- **Voltage Range:** Typically designed for standard line-to-line voltages, with adjustable settings to accommodate different system requirements.

Operational Principles of the SKE 11 Relay

How Does the SKE 11 Check Synchronization?

The SKE 11 relay performs continuous monitoring of incoming electrical parameters from the generator and the grid. When a synchronization attempt is initiated, the relay compares the parameters in real-time:

- Voltage Compatibility: Ensures the generator voltage matches the grid voltage within preset limits.
- Frequency Compatibility: Checks that the generator's frequency aligns with the grid frequency.
- Phase Sequence and Phase Angle: Verifies that phase sequences are identical and the phase angle difference is within permissible limits.

If all parameters are within the pre-set tolerances, the relay allows the closing of the synchronizing contact, triggering the circuit breaker to connect the generator to the grid. If any parameter deviates beyond the set thresholds, the relay prevents synchronization, alerting operators to rectify the conditions.

Sequence of Operations

- Monitoring: Continuously observe voltage, frequency, and phase parameters.
- Detection of Synchronization Signal: When the operator initiates a synchronization request, the relay evaluates the parameters.
- Comparison & Decision: The relay's internal circuitry compares real-time measurements against configured setpoints.
- Synchronization Approval or Rejection: If parameters are acceptable, the relay energizes its output contact to close the breaker; if not, it remains open.
- Post-Synchronization Monitoring: After connection, the relay continues to monitor parameters to detect any anomalies, disconnecting if necessary.
