Sample PGT Physics Questions and Answers

Below, we present a curated list of frequently asked questions with detailed answers to enhance your understanding.

Question 1: State Newton's Second Law of Motion and derive the equation for a particle moving with constant acceleration.

Answer:

Newton's Second Law of Motion states that the force acting on an object is equal to the rate of change of its momentum:

$$\mathbf{F} = \frac{d\mathbf{p}}{dt}$$

For a constant mass m , where momentum $\mathbf{p} = m\mathbf{v}$, the law simplifies to:

$$\mathbf{F} = m \frac{d\mathbf{v}}{dt} = m\mathbf{a}$$

Derivation for a particle moving with constant acceleration a :

Starting with the basic kinematic equations:

- $v = u + at$
- $s = ut + \frac{1}{2}at^2$
- $v^2 = u^2 + 2as$

Where:

- u = initial velocity
- v = final velocity
- s = displacement
- a = acceleration
- t = time

The relation between force and motion is thus established via:

$$F = ma$$

This fundamental equation underpins much of classical mechanics and is essential for solving various problems in physics.

Question 2: What is Coulomb's Law? State its mathematical form and explain the variables involved.

Answer:

Coulomb's Law describes the electrostatic force of attraction or repulsion between two point charges. It states:

The electrostatic force (F) between two point charges is directly proportional to the product of the magnitudes of the charges and inversely proportional to the square of the distance between them.

Mathematically:

$$F = k \frac{|q_1 q_2|}{r^2}$$

Where:

- (F) = magnitude of the electrostatic force (in Newtons)
- (q_1, q_2) = magnitudes of the two point charges (in Coulombs)
- (r) = distance between the charges (in meters)
- (k) = Coulomb's constant, approximately $9 \times 10^9 \text{ Nm}^2/\text{C}^2$

Key Points:

- The force is attractive if charges are of opposite signs and repulsive if they are of the same sign.
- The law applies in a vacuum or air; in other media, the force is modified by the dielectric constant.

Question 3: Describe the concept of electric potential and derive the expression for the potential at a point due to a point charge.

Answer:

Electric potential at a point is defined as the work done per unit charge in bringing a small positive test charge from infinity to that point, without acceleration.

Mathematically:

$$V = \frac{W}{q}$$

where (W) is work done, and (q) is the test charge.

Derivation for a point charge (q) :

The electric potential (V) due to a point charge at a distance (r) is:

$$V = k \frac{q}{r}$$

Explanation:

- Since electric potential (V) is scalar, it adds algebraically.
- The potential at a distance (r) from a point charge (q) is derived from the work done in bringing a test charge (q_0) from infinity to the point:

$$W = \int_{\infty}^r F \, dr = \int_{\infty}^r k \frac{q q_0}{r'^2} \, dr' = k q q_0 \left[-\frac{1}{r'} \right]_{\infty}^r = k \frac{q q_0}{r}$$

Dividing by (q_0) :

$$V = \frac{W}{q_0} = k \frac{q}{r}$$

Note: The potential is positive or negative depending on the sign of the charge.

Question 1: Conceptual MCQ

Which of the following quantities is invariant under Galilean transformation?

- a) Velocity
- b) Momentum

- d) Force

Answer: c) Mass

Explanation: Mass remains invariant under Galilean transformations, while velocity, momentum, and force are frame-dependent.

Question 2: Numerical Problem

A car accelerates uniformly from 0 to 20 m/s in 10 seconds. Find the acceleration and the total distance covered.

Solution:

- Acceleration (a):

$$[a = \frac{v - u}{t} = \frac{20 \text{ m/s} - 0}{10 \text{ s}} = 2 \text{ m/s}^2]$$

- Distance (s):

$$[s = ut + \frac{1}{2} a t^2 = 0 + \frac{1}{2} \times 2 \times (10)^2 = 1 \times 100 = 100 \text{ m}]$$

Answer:

Acceleration = 2 m/s²

Distance covered = 100 meters

Question 3: Derivation Question

Derive the relation $(v^2 = u^2 + 2as)$ for uniformly accelerated motion.

Answer:

Starting from the first equation of motion:

$$[v = u + at]$$

Express time (t) from this:

$$[t = \frac{v - u}{a}]$$

Using the second equation of motion:

$$[s = ut + \frac{1}{2} a t^2]$$

Substitute (t) :

$$[s = u \left(\frac{v - u}{a} \right) + \frac{1}{2} a \left(\frac{v - u}{a} \right)^2]$$

Simplify:

$$[s = \frac{u(v - u)}{a} + \frac{1}{2} a \times \frac{(v - u)^2}{a^2}]$$

$$[s = \frac{u(v - u)}{a} + \frac{(v - u)^2}{2a}]$$

Multiply through by $(2a)$:

$$[2a s = 2 u (v - u) + (v - u)^2]$$

Expand:

$$[2a s = 2 u v - 2 u^2 + v^2 - 2 u v + u^2]$$

Simplify:

$$[2a s = - u^2 + v^2]$$

Rearranged as:

$$[v^2 = u^2 + 2 a s]$$

> - A) Zero

- > - B) Positive and increases as the block slides
- > - C) Negative and decreases as the block slides
- > - D) Negative and remains constant
- > - E) Positive and remains constant

Strategy: Recognize that friction opposes motion, so the work done by friction is negative when the object slides down. The correct answer is C.
