Function of chloroplast: Chloroplasts are the site of photosynthesis, where light energy is converted into chemical energy stored in glucose. They contain the pigment chlorophyll, which captures light energy.

Question 2: Explain the process of digestion in the human alimentary canal.

Answer:

Digestion begins in the mouth, where food is chewed and mixed with saliva containing enzymes like amylase, which starts starch breakdown. It continues in the stomach, where gastric juices with acids and enzymes further digest proteins. The food then passes into the small intestine, where most digestion and absorption occur, aided by enzymes from the pancreas and intestinal lining. Waste products move into the large intestine for water absorption, and undigested material is expelled through the anus.

Question 3: Describe Mendel's law of segregation with an example.

Answer:

Mendel's law of segregation states that during the formation of gametes, the two alleles for a trait separate so that each gamete carries only one allele. For example, in pea plants, the gene for flower color has two alleles: purple (dominant) and white (recessive). A heterozygous plant (Pp) produces

gametes with either P or p. When crossing two heterozygous plants, the offspring have a genotypic ratio of 1:2:1 (PP:Pp:pp) and phenotypic ratio of 3:1 (purple:white).

Sample Question Analysis from the 2013 Paper

Example Question:

The graph shows the effect of temperature on enzyme activity. Describe the trend shown and explain why enzyme activity decreases at high temperatures.

Expert Explanation:

The graph demonstrates that enzyme activity increases with temperature up to an optimum point, after which it declines sharply. This trend indicates that enzymes are more active at higher temperatures due to increased kinetic energy, resulting in more frequent collisions with substrate molecules. However, beyond the optimum temperature, enzymes begin to denature, losing their specific shape and thus their activity decreases. The sharp decline reflects the loss of enzyme function due to denaturation at elevated temperatures.

Key Points in Answer:

- Identification of the increasing trend up to the optimum point.
- Explanation of kinetic energy and collision frequency.
- Clarification of enzyme denaturation at high temperatures.
